

# How much would a windfall tax on bank profits raise?

February 2024

## Summary

- A number of European countries, including the Netherlands, Italy, Spain and Czechia, have introduced higher taxes on the windfall profits banks are making from high interest rates.
- Based on newly announced annual results, a windfall tax in the UK would raise between **£3.5bn and £14bn from the 2023 profits of the big four banks alone**, depending on how it is designed.

## The public are paying the price of banks' windfall profits

- Banks are receiving tens of billions of pounds of public money due to the way in which the Bank of England currently remunerates central bank reserves.
  - [Analysis](#) from former BoE deputy governor Sir Paul Tucker suggests that **banks are due to receive £42bn and £33bn in 2023 and 2024** from interest paid on risk-free reserves. The costs of this are ultimately borne by the Treasury.
- Higher interest rates have also enabled banks to charge households and firms more for mortgages and other loans. Banks are making exorbitant profits by [not passing these gains onto depositors](#).
- The UK's big four banks - [HSBC](#), [Barclays](#), [Lloyds](#) and [Natwest](#) - have reported pre-tax profits of £44.3bn for 2023. This is more than four times the profits recorded in 2020, before rates started rising.
- There is strong public support for implementing a windfall tax. [YouGov polling](#) commissioned by Positive Money in September 2023 found that 58% of UK adults support a one-off tax on banks, while only 12% opposed. There was majority support among voters for each of the main political parties.

## Option 1: reversing recent cuts to the existing surcharge and banking levy

- The government introduced a bank profits surcharge in [2015](#), in recognition of the need for banks to "make a fair contribution in respect of the potential risks they pose to the UK financial system and wider economy." However, while taxes have been raised on other sectors enjoying windfalls (namely energy), the banking surcharge has recently been cut from 8% to 3%, and the bank levy has also been cut.
- In contrast to this 60% cut to the surcharge in the UK, the Dutch parliament has voted to increase the country's bank levy by [70%](#).
- Combining the most recent results for the big four banks with forecasts from the OBR's fiscal outlook, it can be estimated that reversing cuts to both the surcharge and bank levy could be expected to raise an additional **£3.5bn** this year.

## Option 2: raising the surcharge in line with the Energy Profits Levy

- The government could raise significantly more revenue by raising the banking surcharge in line with the 35% Energy Profits Levy imposed on oil and gas companies.

- Doing so could be expected to increase the tax intake by more than **£14bn** from the 2023 profits of the big four banks alone.

### Option 3: the Thatcher government model

- In 1981, the Thatcher government introduced a 2.5% tax on banks' non-interest bearing deposits. As Thatcher explained in her [memoirs](#): "Naturally, the banks strongly opposed this; but the fact remained that they had made their large profits as a result of our policy of high interest rates rather than because of increased efficiency or better service to the customer."
- The BoE's latest data suggests there are more than £418bn of non-interest bearing deposits that could be eligible for such a levy today, with more than [£253bn](#) held by households and more than [£165bn](#) held by non-financial firms. A 2.5% tax would therefore raise around **£10.5bn**.

### Option 4: the Italian model

- The Italian government announced a [40% windfall tax](#) on the difference between banks' net interest income (NII) in 2021 and the figure for 2022 or 2023, depending on which is larger.
- In the UK the big four banks' 2023 NII was £65.9bn - £19.8bn more than £46.1bn in 2021. A 40% levy on this difference would therefore raise **£7.9bn**.
- The Italian government subsequently watered down its windfall tax, capping it at 0.1% of total bank assets. However, such a cap would still allow around £13bn to be raised in the UK.

### Option 5: the Czech model

- The Czech government has introduced a [60% windfall tax](#) on bank profits exceeding 120% of the 2018-21 average, which will apply for three years from 2023.
- The big four banks in the UK recorded an average pre-tax profit of £25.9bn between 2018 and 2021. Replicating the Czech tax would therefore raise more than **£7.3bn** from these banks' profits in 2023.

### Option 6: the Spanish model

- Spain has introduced a [4.8% windfall levy](#) on banks' NII and net commissions above a threshold of 800 million euros, which has now been [extended indefinitely](#).
- In the UK the four biggest banks reported NII and net commissions of £95.5bn 2023. A 4.8% levy would therefore raise **£4.5bn** from these banks alone in 2023.
